

Assignment #5 - PHP + MySQL

[Re-submit Assignment](#)

Due Sunday by 11:59pm **Points** 10 **Submitting** a file upload **File Types** php
Available until Apr 5 at 11:59pm

You need to implement a web application that is split in three parts, namely, Webpage, PHP and MySQL. Each of them will be used accordingly to solve a simple problem described below. Remember to implement the logic in the most secure way of your knowledge.

PHP

- Implement a PHP function that reads in input a string from the user and store it in a table (in a field called "Name")
- The function should be able to read the content of the file and store it in a table too (in a field called "Content")

Webpage

- The user must be able to upload a text file (and nothing more)
- The user must be able to input a string using a text box
- The webpage prints in output the content of the database, that is, the content of each file with the specified name
 - This should happen every time the page loads, even if the user has accessed the page for the first time

MySQL

- You need to create a database that contains at least a table to store the information in input to the webpage

You need to submit your web application in one or more .php files, no other formats are allowed.
