```

Your code should contain a PHP function that, accepting the string of 1000 numbers in input, is able to:

- 1) Find the 5 adjacent numbers that multiplied together give the largest product.
- 2) Given the product from above, computes the sum of the factorial of each term of such product

Example, if the product is 5046, computes $5! + 0! + 4! + 6!$

NOTE:

- If the file doesn't contain 1000 numbers or contains some characters in between, it should be discarded and the application should inform the user that the file is not format correctly.
- Add a tester function to check the behavior of your PHP function, plus checks on the file content.
- Follow the guidelines on how to safely let the users upload files discussed and showed in class to avoid losing points.
